Module 4 Challenge
Due: 10/11/22

Analysis
Py City Schools Data

Analysis of this data has uncovered multiple trends that may be helpful in making strategic decisions regarding budgets and priorities in the school district. The data-based differences between the charter school and district schools in the data set are significant.

The charter schools in this district show consistently higher scores in both reading and math than the district schools. The percentage of students passing these subjects is much higher in the charter schools.

It is also clear that the charter schools have far fewer students enrolled than their district counterparts. The data shows that the smaller schools are generating higher math and reading scores, and higher overall percentages of passing grades.

As the district moves forward in making strategic decisions surrounding budget and priorities, these trends are worth consideration and further investigation.
